

ArcelorMittal Dofasco is pleased to present this environmental product declaration (EPD) for Hollow Structural Sections. This EPD was developed in compliance with CAN/CSA-ISO 14025 and ISO 21930 and has been verified under Groupe AGÉCO.

The EPD includes life cycle assessment (LCA) results for a cradle to gate with options scope.

For more information about ArcelorMittal Dofasco and the XCarb product offers, please visit <https://dofasco.arcelormittal.com/sustainability/xcarb>

This environmental product declaration (EPD) is in accordance with CAN/CSA-ISO 14025, ISO 21930:2017 and the PCR noted below. EPDs within the same product category but from different programs may not be comparable.

**Limitations**

The environmental impact results of steel products in this document are based on a declared unit and therefore do not provide sufficient information to establish comparisons. The results shall not be used for comparisons without knowledge of how the physical properties of the steel product impact the precise function at the construction level. The environmental impact results shall be converted to a functional unit basis before any comparison is attempted. See Section 3.10 for additional EPD comparability guidelines. Environmental declarations from different programs (ISO 14025) may not be comparable.

This is a product-specific environmental product declaration (EPD) describing the environmental performance of hollow structural sections manufactured in Canada using XCarb™ RRP hot rolled coils from the ArcelorMittal Dofasco site. This EPD is only applicable to hollow structural sections produced in Canada using ArcelorMittal XCarb™ RRP steel.

EPD commissioner and owner	Period of validity	Program operator and registration number	Product Category Rule	LCA and EPD consultants
ArcelorMittal Dofasco	November 29, 2023 - November 27, 2028	CSA Group #3079-2583	Product Category Rule Guidance for Building-Related Products and Services Part B: Designated Steel Construction Product EPD Requirements v.2	ArcelorMittal

### Product description

Hollow structural sections are specified by the ASTM A1085 standard.

### Declared units

1 metric ton of hollow structural sections with a density of 7,800 kg/m<sup>3</sup>.

### Material content (% of total product mass)

Steel substrate: 98%  
Metallic coating (zinc or equivalent): 2%

### Scope and system boundary

Cradle-to-gate with options: production (A1 to A3), C1 to C4 and D.

### What is a Life Cycle Assessment (LCA)?

LCA is a science-based and internationally recognized tool to evaluate the relative potential environmental and human health impacts of products and services throughout their life cycle, beginning with raw material extraction and including all aspects of transportation, production, use, and end-of-life treatment. The method is defined by the International Organization for Standardization (ISO) 14040 and 14044 standards.

### Why an Environmental Product Declaration (EPD)?

ArcelorMittal is seeking to communicate their environmental performances to clients and to position their products through a rigorous and recognized approach, an EPD. By selecting products with an EPD, building projects can earn credits towards the Leadership in Energy and Environmental Design (LEED) rating system certification, among others. In the latest versions of the program (LEED v4 and v4.1), points are awarded in the Materials and Resources category.

This EPD summary provides an overview of the full ISO 14025 compliant EPD registered with CSA Group.

**Environmental impacts**

The life cycle environmental impacts of 1 metric ton of hollow structural sections (A1-A3, C1-C4 and D<sup>1</sup>) are summarized below for the main environmental indicators (based on life cycle impact assessment method TRACI 2.1). Refer to the LCA report or full EPD for more detailed results. Results on resource use, generated waste and output flows are presented in the full EPD.

These results are only applicable to hollow structural sections produced using ArcelorMittal Dofasco XCarb™ recycled and renewably produced steel.

Per metric ton of hollow structural sections

<sup>1</sup> A1 = raw material supply (raw material extraction and processing, production of hot rolled coils, etc.), A2 = transport of raw materials (transportation from suppliers of steel to manufacturing facilities), A3 = manufacturing (roll forming) C1 = building deconstruction, C2 = transportation to scrap processing, C3 = scrap processing, C4 = waste disposal, D = end of life recycling credit.

## 1. Description of ArcelorMittal and XCarb™

ArcelorMittal is the world's leading steel and mining company with 154,000 employees, a manufacturing presence across 16 countries and 59 million metric tons of crude steel production in 2022. In Canada, ArcelorMittal Dofasco is Hamilton's largest private sector employer with more than 4,500 employees and shipping 4.5 million tons of high-quality flat carbon steel annually.

XCarb™ is the new brand name for ArcelorMittal's ongoing global program of steelmaking innovation targeted at carbon-neutral steel by 2050. The initiatives that are part of XCarb® aim to reduce the carbon footprint of ArcelorMittal and of its customers.

The XCarb™ recycled and renewably produced applies to products made via the Electric Arc Furnace route using scrap steel and 100% renewable energy.

By using above average scrap content and renewable energy, XCarb™ recycled and renewably produced products have a CO<sub>2</sub> footprint per tonne of finished steel that is significantly lower than the industry average.

The electricity used in the steelmaking process is independently verified, with a 'Guarantee of Origin' given that it is from renewable sources. This is ensured by the purchasing of Renewable Energy Certificates (RECs), a market-based offering that certifies the bearer owns a specific amount (in megawatt-hours) of electricity generated from a renewable energy resource. However, to conform with the UL Part A PCR requirements, the environmental benefit associated with the use of RECs is not captured in this EPD.

## 2. Description of product

### 2.1. Standards

The hollow structural sections in this EPD are specified by the ASTM A1085 standard.

## 2.2. Production of hollow structural sections

XCarb Recycled and Renewably Produced (RRP) coils are produced through the Electric Arc Furnace (EAF) steelmaking route at ArcelorMittal Dofasco (AMD). The process begins with raw materials extraction (mainly iron ore, hard coal, and limestone) which are prepared in the coke making and pelletizing plants, and which are then fed into the Blast Furnace (BF). Pig iron, the BF product is then fed into the EAF with steel scrap which typically accounts for 75% of the load weight. The EAF process melts the scrap, removes impurities, and reduces the carbon level in the liquid steel. Then the outgoing liquid steel is refined in a ladle metallurgy operation with added elements in order to give a targeted chemical composition. Liquid steel from the ladle is then continuously cast through a mold to produce slabs which are subsequently hot rolled into coils. This product is known as hot rolled steel and is the semi-finished product used for manufacturing hollow structural sections at customer's downstream tube mills.

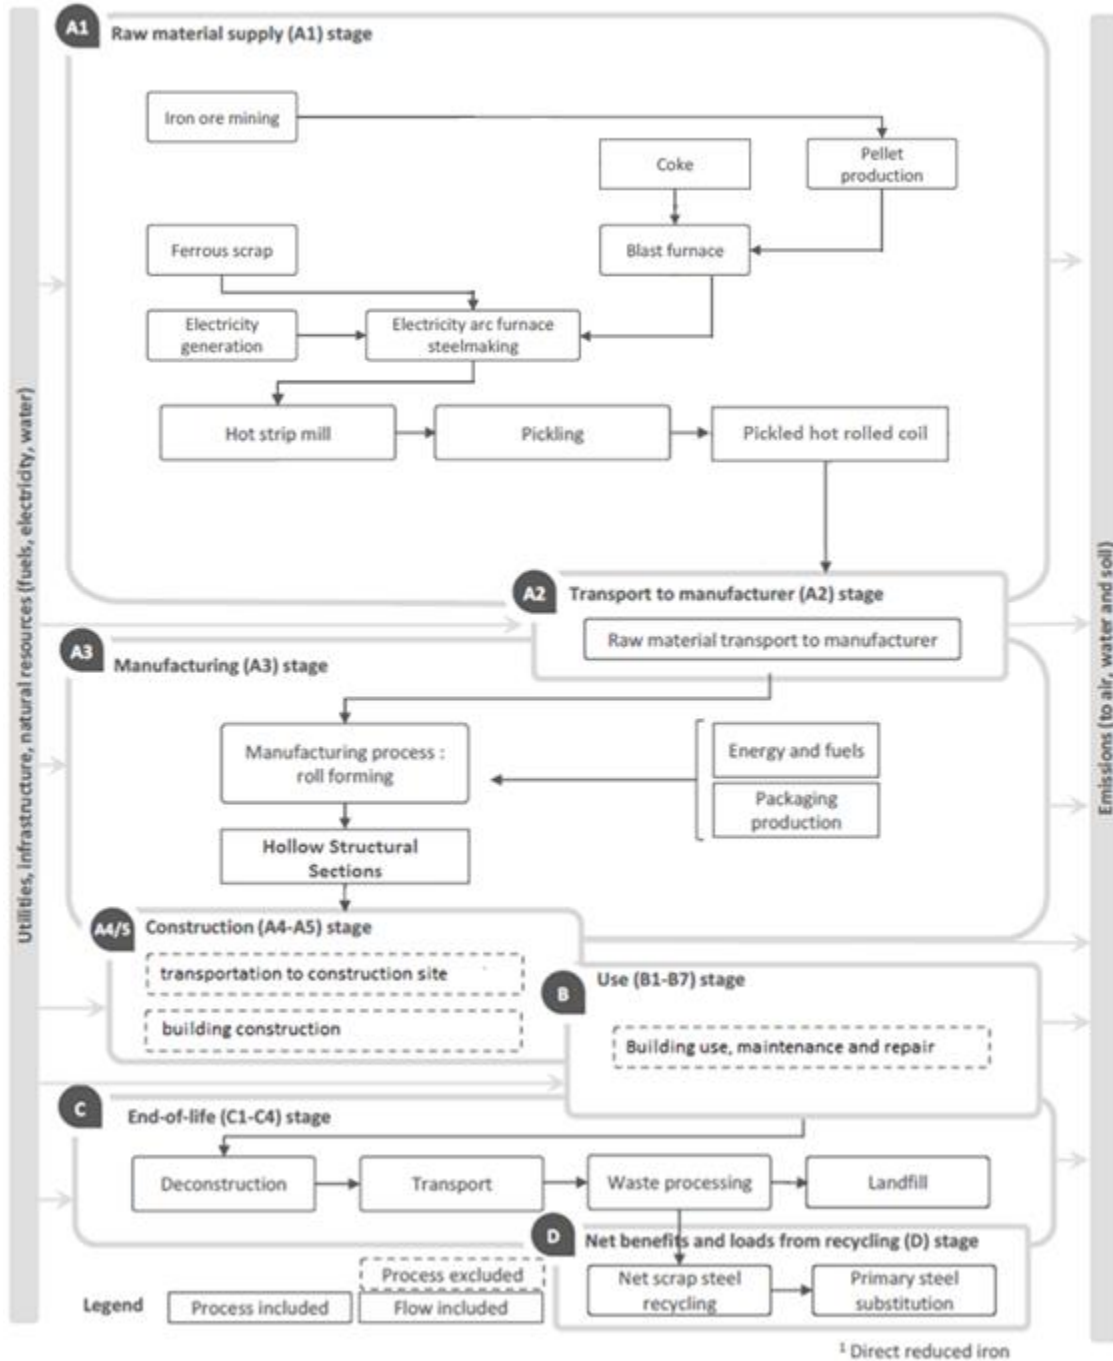

Figure 1: Process flow diagram for hollow structural sections production

### 2.3. Material content

The chemical composition and physical properties of the hot rolled coil used to manufacture HSS is defined in the ASTM A1011 standard.

## 3. Scope of EPD

### 3.1. Declared Unit

The declared unit for this EPD is one metric ton of hollow structural sections.

**Table 1: Declared unit for hollow structural sections**

Parameter	Value (SI units)
Declared Unit	1 metric ton
Density	7,800 kg/m <sup>3</sup>

### 3.2. System boundaries

The product stage is included in the **cradle-to-gate with options** system boundary as shown in Table 2. Note that the reference service life is not specified as the study does not cover life cycle stages for product use.

**Table 2: Life cycle stages considered according to the PCR**

[x: included in the scope, MND: module not declared]

Product Stage	Included within scope
A1 Raw material supply	x
A2 Transport	x
A3 Manufacturing	x
Construction Process Stage	
A4 Transport to site	MND
A5 Assembly/Install	MND
Use Stage	
B1 Use	MND
B2 Maintenance	MND
B3 Repair	MND
B4 Replacement	MND
B5 Refurbishment	MND
Use Stage, related to the operation of the building	
B6 Operational energy use	MND

<b>B7</b>	Operational water use	MND
<b>End of Life stage</b>		
<b>C1</b>	Deconstruction	x
<b>C2</b>	Transport	x
<b>C3</b>	Waste processing	x
<b>C4</b>	Disposal	x
<b>Benefits and loads beyond the system boundary</b>		
<b>D</b>	Reuse, recovery, and/or recycling potentials	x

The primary data collected in this study for module A1 represents the cradle to mill gate production of hot rolled coil through the ArcelorMittal Dofasco EAF stream and the manufacturing of steel tubes.

#### 4. Environmental impacts

This cradle-to-gate with options life cycle assessment is compliant with ISO 14040 and 14044 and the Product Category Rule (PCR) Guidance for Building-Related Products and Services Part B: Designated Steel Construction Product EPD Requirements v.2. Environmental impacts were calculated using the TRACI 2.1 impact assessment methods, thus yielding six environmental impact categories. A description of these impact categories is provided in the glossary (section 5). These six impact categories are globally deemed mature enough to be included in Type III environmental declarations.

##### 4.1. Criteria for the exclusion of inputs and outputs

This study complies with the rules defined by worldsteel's procedure of data inventory.

1. All energetic inputs to the process stages were recorded, including heating fuels, electricity, steam and compressed air.
2. The sum of the excluded material flows must not exceed 5% of mass, energy or environmental relevance. However, in reality at least 99.9% of material inputs to each process stage were included, which is in line with the ISO 21930 requirement (<1%)
3. Input scrap does not carry a burden in module A1.

##### 4.2. Data quality

###### Data sources

Primary data was collected from the Arcelormittal Dofasco site in 2021 for hot rolled coil production and steel tube manufacturing. The data is representative of the North American context and technologies used.

**Table 3** presents the main sources of data used for the LCA. The LCA model was developed with Gabi 10.7 software and database. Table 4 summarizes the data quality assessment for each module included in the LCA based on the parameters listed in the PCR.

**Table 3: Data sources for the LCA of hollow structural sections**

Module	Main processes	Data source	Region	Year
A1	Raw material extraction and processing to produce hollow structural sections	Primary data collection	Hamilton, Ontario	2021
A2	Transportation to fabricators	Primary data collection	Canada	12 consecutive months from January 2021 - December 2021
A3	hollow structural sections manufacturing	Secondary data collection	Canada	2021
C1	Deconstruction	GaBi 10.7	Global	2021
C2	Transportation to waste processing	GaBi 10.7	US	2021
C3	Waste Processing	Ecoinvent 3.8	Global	2021
C4	Disposal of waste	GaBi 10.7	Europe	2021
D	Credit for end-of-life recycling	worldsteel	Global	2020

**Table 4: Data quality assessment**

Data quality parameters	Data quality assessment for each module
<b>Time-related coverage</b>	All data are from within the last 10 years with most primary data collected in 2021. Time-related coverage is therefore considered good.
<b>Geographical coverage</b>	The data for the manufacturing of HSS (A3) is specific to the manufacturing location in Canada. Primary data collection from the ArcelorMittal Dofasco site (A1 stage).
<b>Technology coverage</b>	Very recent primary data collection covering Electric Arc Furnace steel making, the predominant steelmaking technology route in North America.
<b>Reliability</b>	The majority of the relevant foreground data are measured data or calculated based on primary information collected from the ArcelorMittal Dofasco site (A1 stage) or manufacturers (A2 and A3 stages). Therefore, reliability is considered to be high for A1-A3. Secondary data for end-of-life stages are considered good.
<b>Completeness</b>	Primary data collected represented annual operations inclusive of seasonal and other normal annual fluctuations in operations. All relevant and specific processes were considered and modeled to represent the production of HSS. The completeness of the data used for A1-A3 is considered high.
<b>Representativeness</b>	The representativeness is good overall. See time-related, geography and technology coverages parameters above.
<b>Consistency</b>	All primary data were collected with the same level of detail (i.e., using consistent data collection templates), while all background data were sourced from the GaBi and Ecoinvent databases. Allocation and other methodological choices were made consistently throughout the model.
<b>Reproducibility</b>	Reproducibility is supported as much as possible through the disclosure of the weighted average inventory, datasets choices, and modeling approaches in this report.

### 4.3. Allocation

Steel production generates a number of co-products from coke ovens, the blast furnace, basic oxygen furnace and Electric Arc Furnace (EAF) that are sold to and used by other industries. These include slags, process gases and organic products from coke making. The processes that produce these co-products cannot be further sub-divided into sub-processes related to each co-product, so allocation is required.

The allocation method used in this study was developed by the worldsteel association and EUROFER to be in line with EN 15804 and ISO 21930:2017 standards.

The methodology is based on physical allocation and takes account of the manner in which changes in inputs and outputs affect the production of co-products and material flows that carry specific inherent properties. The method is deemed to provide the most representative partitioning of the processes involved.

#### 4.4. Life cycle impact assessment – Results

Results for 1 metric ton (mt) of hollow structural sections are presented in Table 6 to Table 8.

These results are only applicable to hollow structural sections produced using ArcelorMittal Dofasco XCarb™ recycled and renewably produced steel.

**Table 5: Results for the environmental impacts for 1 metric ton of hollow structural sections**

Per metric ton of hollow structural sections								
Environmental Impact indicator (IPCC 2013 (AR5))	A1	A2	A3	C1	C2	C3	C4	D
<b>GWP 100 [kg CO<sub>2</sub> eq.]</b>	1.03E+03	1.20E+01	2.54E+01	6.66E-01	2.23E+01	6.68E-01	1.30E+00	-2.41E+02
Environmental Impact indicator (TRACI 2.1)	A1	A2	A3	C1	C2	C3	C4	D
<b>AP [kg SO<sub>2</sub> eq.]</b>	1.85E+00	3.42E-02	1.01E-01	2.77E-03	4.60E-02	2.29E-03	8.53E-03	-3.71E-01
<b>EP [kg N eq.]</b>	7.36E-02	3.58E-03	1.35E-02	2.46E-04	5.52E-03	1.58E-04	7.40E-04	-2.36E-02
<b>ODP [kg CFC 11 eq.]</b>	3.51E-12	2.26E-14	8.08E-10	1.21E-15	4.17E-14	5.57E-14	2.36E-11	-7.82E-13
<b>SFP [kg O<sub>3</sub> eq.]</b>	3.36E+01	7.79E-01	1.15E+00	9.27E-02	1.04E+00	2.78E-02	1.64E-01	-5.15E+00
<b>ADP<sub>fossil</sub> [MJ]</b>	1.01E+03	2.22E+01	5.49E+01	1.19E+00	4.11E+01	7.66E-01	2.11E+00	-1.61E+01

**Comparability:** Comparisons cannot be made between product-specific or industry average EPDs at the design stage of a project, before a building has been specified. Comparisons may be made between product-specific or industry average EPDs at the time of product purchase when product performance and specifications have been established and serve as a functional unit for comparison. Environmental impact results shall be converted to a functional unit basis before any comparison is attempted.

Any comparison of EPDs shall be subject to the requirements of ISO 21930. EPDs are not comparative assertions and are either not comparable or have limited comparability when they have different system boundaries, are based on different product category rules or are missing relevant environmental impacts. Such comparison can be inaccurate and could lead to erroneous selection of materials or products which are higher impact, at least in some impact categories.

**Module D Considerations:** The values in Module D include a recognition of the benefits or impacts related to steel recycling which occur at the end of the product's service life. The rate of steel recycling and related processes will evolve over time. The results included in Module D attempt to capture future benefits, or impacts, but are based on a methodology that uses current industry-average data reflecting current processes.

**Table 7: Results for the resource use of hollow structural sections**

Per metric ton of hollow structural sections								
Resource use flows	A1	A2	A3	C1	C2	C3	C4	D
NRPre [MJ]	1.45E+04	1.68E+02	6.56E+02	8.99E+00	3.11E+02	1.40E+01	1.75E+01	-2.41E+03

SM [kg]	8.02E+02		4.12E-03					1.45E+02

For the North American context, hazardous waste is defined by the United States Resource Conservation and Recovery Act legislation (40 CFR 261.33) (Resource Conservation and Recovery Act, 2014), except in module A3 where the classification of the manufacturer was used. All output flows and waste generated during the manufacturing processes are presented in Table 8).

**Table 8: Results for waste and output flows generated for hollow structural sections**

Per metric ton of hollow structural sections								
Waste and output flows	A1	A2	A3	C1	C2	C3	C4	D
MR [kg]						9.2E+02		
HWD [kg]			7.65E-04					
NHWD [kg]			1.66E-05			8.0E+01		
CRU [kg]								
MER [kg]								
EE [MJ]								
HLRW [kg]	1.55E-03	5.52E-07	9.04E-05	2.95E-08	1.02E-06	2.86E-06	3.64E-07	2.70E-07
ILLRW [kg]	2.61E-02	1.01E-05	1.51E-03	5.39E-07	1.86E-05	4.77E-05	5.62E-06	4.96E-06

**Disclaimer:** This Environmental Product Declaration (EPD) conforms to ISO 14025, 14040, ISO 14044, and ISO 21930.

**Scope of results reported:** The PCR requires the reporting of a limited set of LCA metrics; therefore, there may be relevant environmental impacts beyond those disclosed by this EPD. The EPD does not indicate that any environmental or social performance benchmarks are met nor thresholds exceeded.

**Accuracy of results:** This EPD has been developed in accordance with the PCR applicable for the identified product following the principles, requirements and guidelines of the ISO 14040, ISO 14044, ISO 14025 and ISO 21930 standards. The results in this EPD are estimations of potential impacts. The accuracy of results in different EPDs may vary as a result of value choices, background data assumptions and quality of data collected.

**Comparability:** EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. Such comparisons can be inaccurate, and could lead to the erroneous selection of materials or products which are higher-impact, at least in some impact categories. Any comparison of EPDs shall be subject to the requirements of ISO 21930. For comparison of EPDs which report different module scopes, such that one EPD includes Module D and the other does not, the comparison shall only be made on the basis of Modules A1, A2, and A3. Additionally, when Module D is included in the EPDs being compared, all EPDs must use the same methodology for calculation of Module D values.

Statistical distribution of results was not provided in this study because the primary data was collected from one site only.

## 4.5. End of Life Recycling

End of life recycling is one of the most important sustainability attributes for the steel industry and it is essential that the benefits associated with recycling at the end of life be recognized. As a result of a global scrap shortage in the industry, all scrap that is recovered at the end life will offset primary BOF steel production which has significantly larger environmental footprint than secondary EAF steel production route.

Table 9 below shows the assumptions used for end-of-life modeling in this study.

**Table 9: End of life assumptions for hollow structural sections production**

Assumption	Value
End of life recycling rate	92%
Recycled content	75.35%
Reuse at end of life	0%

## 4.6. Life cycle impact assessment – Interpretation

Global Warming Potential:

The global warming potential indicator is dominated by emissions of CO<sub>2</sub> (~90%) at the Blast Furnace and by energy production and use all along the production steps. Methane also contributes to a lower extent (6%) to GWP from coal mining and coke making operations.

Acidification Potential:

Sulphur dioxide and nitrogen oxides together contribute most to the acidification potential indicator (90%). They arise primarily from electricity production and transportation.

Eutrophication Potential:

The EP for steel products is dominated by emissions to air, which contribute 94% to this impact. The main contributor is nitrogen oxides (90%). Emissions to water that contribute to this impact are from nitrogen containing substances, e.g. nitrate, ammonia.

Ozone Depletion Potential:

Ozone layer depletion indicator value is mainly determined by electricity production for high grade zinc refining.

Smog Formation Potential:

The smog formation potential for steel products is dominated by carbon monoxide coming from the iron ore preparation process which accounts for over 60% of the contribution to this impact. All other major substances contributing to this impact are sulphur dioxide and nitrogen oxides.

ADP fossil:

This indicator is dominated by the use of natural gas and the use of hard coal at the Blast Furnace. The balance is accounted by the use of crude oil and lignite.

## 5. GLOSSARY

### 5.1. Acronyms

AISI – American Iron and Steel Institute

BF – Blast Furnace

BOF – Blast Oxygen Furnace

CSPI – Corrugated Steel Pipe Institute

CSA - Canadian Standard Association

EAF – Electric Arc Furnace

EPD - Environmental Product Declaration

ISO - International Organization for Standardization

LCA - Life cycle assessment

LCI – Life cycle inventory

## 5.2. PCR - Product Category Rule Environmental impact categories and parameters assessed

**Acidification potential (kg SO<sub>2</sub> equivalent):** This impact category is expressed in sulphur dioxide equivalents and refers to the change in acidity in soil or water due to the addition of certain substances (e.g., nitric acid, sulfuric acid and ammonia) which can build or release hydrogen ions (H<sup>+</sup>) through interactions with the local environment (US EPA, 2012).

**Abiotic resource depletion potential of non-renewable (fossil) energy resources (MJ, net calorific value):** This indicator measures the reduction of raw natural resources (e.g., minerals) due to their extraction. It is expressed in units of kg of antimony equivalents according to concentration reserves and rate of de-accumulation. This indicator also refers to the reduction of fossil fuels due to their extraction for consumption and is expressed in megajoules (PRé, 2021).

**Eutrophication (kg N equivalent):** This impact category measures the enrichment of an ecosystem (i.e., aquatic or terrestrial) due to the release of nutrients (e.g., nitrates, phosphates) which increases biological activity. In an aquatic environment, this activity results in the growth of algae which consume dissolved oxygen present in water when they degrade and thus affect species sensitive to the concentration of dissolved oxygen. This category is expressed in nitrogen equivalents (US EPA, 2012).

**Global warming (kg CO<sub>2</sub> equivalent):** This indicator refers to the impact of a temperature increase on the global climate patterns due to the release of greenhouse gases (GHG) (e.g., carbon dioxide and methane). GHG emissions contribute to the increase in the absorption of radiation from the sun at the earth's surface. Global warming impact is expressed in units of kg of carbon dioxide equivalents (US EPA, 2012).

**Ozone depletion (kg CFC 11 equivalent):** This indicator measures the potential of stratospheric ozone level reduction and thus the increase in ultraviolet (UV) radiation causing higher risks to human health (e.g., skin cancers and cataracts). Pollutants that are responsible for this impact are often released by cooling systems (e.g., refrigerants such as chlorofluorocarbons). It is expressed in kg of trichlorofluoromethane equivalents (US EPA, 2012).

**Smog (kg O<sub>3</sub> equivalent):** This impact category covers the emissions of pollutants such as nitrogen oxides and volatile organic compounds (VOCs) at the ground level ozone. When reacting with the sunlight, these pollutants create smog. It is expressed in kg of ozone equivalents (US EPA, 2012).

**Recovered energy (MJ, net calorific value):** Energy recovered from disposal of waste in previous systems, such as energy recovery from combustion of landfill gas or energy recovered from other systems using energy sources.

**Renewable/non-renewable primary energy (MJ, net calorific value):** This parameter refers to the use of energy from renewable resources (e.g., wind, solar, hydro) and non-renewable resources (e.g., natural gas, coal, petroleum).

**Renewable/non-renewable secondary fuels (MJ, net calorific value):** Inventory of renewable or non-renewable secondary fuels.

**Secondary material (kg):** Recycled material used to produce a product (ISO, 2020b)

**Use of net freshwater resources (m<sup>3</sup>):** This parameter includes water that is consumed by a system. However, it does not refer to water that is used but returned to the original source (e.g., water for hydroelectric turbines, for cooling or river transportation), or to water lost from a natural system (e.g., due to evaporation of rainwater) (EPD International, 2015).
